

Sentence Calculator

Easily and accurately calculate an inmate's release date

Determining release dates has historically been a manual process utilizing Excel spreadsheets or calendars. Because of the many complexities in these determinations, including how the agency calculates good time and credit time, only select staff members were qualified to calculate release dates.

Enter equivant Corrections' Sentence Calculator, powered by the Northpointe Suite. This functionality is highly configurable to allow agencies to determine how good time and credit time are calculated. Once the configuration is completed, users can simply make a few data entries – sentencing orders, length of sentence, credit time, credit for time served, and linking consecutive or concurrent charges – and the calculator will provide the projected out date.

The Sentence Calculator wizard turns a manual process into an automated one and saves your staff time, while also preventing human errors in calculation.

Key Features

Easily configurable

Ability to calculate good time, credit time, credit for time served

Key data entry options available like linking charges that may be consecutive or concurrent to each other

Easily enter information from sentencing orders

Accurate, projected release dates for each inmate at your fingertips

With equivant Corrections, your agency can:

- Free up staff time to complete other tasks
- Use automation to replace manual, cumbersome processes
- Get rid of your spreadsheet system
- Easily calculate release dates fast and accurately
- Avoid human error in calculations

Upgrade your approach to sentence calculation, save staff time, and improve accuracy.
